

Ansuz X-TC

Wednesday, December 8, 2021
Jason Kennedy

The notion that a network or data switch can make a real difference in a streaming system was radical a year or two back but anyone that's heard what a good one can do in terms of removing hardness and background hash will be fully aware of their potential. Danish company Ansuz grasped that switches can be designed to block high frequency noise earlier than most and makes a range of four models of which the Powerswitch X-TC is the entry model. It allows streamed music to sound more open, relaxed and detailed, taking away any sense of the digital and revealing the beauty of the music in no uncertain terms. A good switch can transform a streaming system and this is certainly a good switch.
